Treatments for Hearing Loss

by Laurie B. Rosenblum, MPH

En Español (Spanish Version)

The goal of treatment for hearing loss is to improve hearing as much as possible. The kinds of treatment used depend on the type of hearing loss and the underlying cause. Conductive hearing loss can often be corrected by medical or surgical treatment. Most types of sensorineural hearing loss are permanent and cannot be corrected medically or surgically, but hearing can be improved with hearing aids and assistive devices. Infrequently, sudden sensorineural hearing loss can be treated with high dose steroids.

Treatment may involve the following:

Medical Treatment
Surgery
Hearing Aids
Assistive Devices
Cochlear Implant
Communication Skills
